NOTICE TO USERS OF THIS REPORT

These are not formal Agricultural Experiment Station research results. Readers are cautioned against drawing conclusions or making recommendations as a result of the summaries in this report. In many instances, data represents only one of several years' results that will ultimately constitute the final formal report for a project.

None of the data are authorized for release or publication without the written prior approval of the New Mexico Agricultural Experiment Station.

Any reference in this report to any person, organization, activities, products, or services related to such person or organization is solely for informational purposes and does not constitute or imply the endorsement or recommendation of New Mexico State University or any of its employees or contractors. NMSU is dedicated to providing equal opportunities in areas of employment and academics without regard to age, ancestry, color, disability, gender identity, genetic information, national origin, race, religion, serious medical condition, sex, sexual orientation, spousal affiliation, or protected veteran status as outlined in federal and state anti-discrimination statutes. The College of Agricultural, Consumer, and Environmental Sciences is an engine for economic and community development in New Mexico. ACES academic programs help students discover new knowledge and become leaders in environmental stewardship, food and fiber production, water use and conservation, and improving the health of all New Mexicans. The College's research and extension outreach arms reach every county in the state and provide research-based knowledge and programs to improve the lives of all New Mexicans.

AGRICULTURAL SCIENCE CENTER LOCATIONS MAP

EXECUTIVE SUMMARY

New Mexico's forests supply many valuable resources to its citizens, including 50% to 75% of all water used by municipalities and agriculture. Unfortunately, forest health in New Mexico and the entire western U.S. is declining due to a combination of factors that include historic fire suppression, increased fuel densities, increased drought, and a lack of proper forest management. As a result of these factors, the dense forests of the Southwest are experiencing some of the most destructive wildfires in history. This trend will likely continue into the near future. Many of the forests that have succumbed to high-severity fires are not regenerating naturally resulting in a loss of forests. Therefore, it is critical to invest in the reforestation pipeline effort (seed, nursery, and planting) for the state and region that will help to benefit forest health, water quality and quantity, carbon sequestration, wildlife habitat, recreation, and many other valuable resources.

The New Mexico Reforestation Center (NMRC) is currently under development and will serve to fill the gaps in the reforestation pipeline, emphasizing both scale and urgency, in the southwestern US while serving as a model for other regions. NMRC's mission is to meet current and future regional reforestation needs through its comprehensive seed bank, nursery, and planting operations combined with research, education, and outreach activities. In 2023, a formal agreement between the USDA Forest Service and the NMRC (via NMSU) was established to address the growing reforestation needs in the region utilizing the expertise and resources of the NMRC. Additionally, in 2023, the NMRC (with NMSU acting as the fiscal agent) received \$18.5 million in state and federal funding to support the initial design and construction of the reforestation facility which will be located at the JTH Forestry Research Center in Mora, NM.

The JTH Forestry Research Center (JTH FRC) will continue to operate as normal in parallel with the activities and efforts of the NMRC. Research in reforestation is critical to continued success. Science-based reforestation has the single greatest potential for climate change mitigation compared to all other land management activities. However, the backlog of reforestation needs across the United States continues to grow each year in direct response to disturbances such as those caused by fire, insects, and disease. This growing backlog has recently generated significant momentum to improve national reforestation efforts as seen by initiatives such as the REPLANT and Executive Order No. 14072. With massive reforestation actions on the horizon, it is critical to implement climate-smart reforestation that addresses how trees are planted for future climatic 3 conditions. *(continues on next page)*

EXECUTIVE SUMMARY

The climate is changing faster than trees can migrate and/or adapt through both natural regeneration and conventional tree planting practices. Therefore, it is fundamental that researchers understand how to build climate resiliency for future forests by examining genetic sources, nursery cultural practices, and planting methods that influence morphological and physiological traits that promote tolerance to drought, heat, insect, and other stress factors that ultimately lead to greater seedling survival after planting.

Currently, the JTH FRC is the only program in the four corner states (NM, UT, AZ, and CO) focusing research efforts along the entire reforestation pipeline. It is also only one of five programs in the entire country dedicated to researching the reforestation pipeline, making it extremely competitive to respond to reforestation challenges, locally and nationally. In 2023, the JTH FRC produced 2 publications addressing: 1) drought conditioning influences on ponderosa pine physiology and morphology and 2) co-planting nitrogen-fixing host trees to facilitate forest regeneration of sandalwood. Research continues to focus on critical topics such as assisted migration and seed transfer guidelines in response to climate change, seedling-based aspen restoration, planting strategies that promote long-term improvements to water resources, and drought-conditioning seedlings during nursery products.

RESEARCH HIGHLIGHTS

EVALUATING VEGETATION CONTROL AND ANIMAL PROTECTION MEASURES FOR POST-FIRE REFORESTATION OF PONDEROSA PINE

Investigators: Dr. Owen Burney (oburney@nmsu.edu) and Dr. Joshua Sloan

PROJECT OVERVIEW

The focus of this study is to compare planted ponderosa pine seedlings under an interaction of animal protection methods (fencing and tree shelters) and vegetation management intensities (none, partial, complete control) to improve reforestation success. Additionally, this research will examine the cost-effectiveness of these treatments.

MEETING THE NEEDS OF NEW MEXICO

This research will benefit all communities of New Mexico due to the added value it has on many ecosystem services that reforestation has on water, recreation, wildlife, timber, and many other valuable resources.

IMPACT

Results from this research are and will continue to be used to inform land managers throughout the western US on reforestation strategies that improve seedling survival and growth.

FUNDING ACKNOWLEDGMENT:

NSF/CREST

OPTIMIZING OUT PLANTING STRATEGIES OF PONDEROSA PINE IN A POST-FIRE ENVIRONMENT THROUGH SEEDLING SIZE, PLANTING WINDOWS, AND NURSERY CONDITIONING

Investigators: Dr. Owen Burney (oburney@nmsu.edu) and Dr. Joshua Sloan

PROJECT OVERVIEW

The focus of this study is to optimize seedling performance by comparing stock size (10 and 30 cubic-inch containers), planting window (summer, fall, spring), and use of drought condition treatments in the nursery.

MEETING THE NEEDS OF NEW MEXICO

This research will benefit all communities of New Mexico due to the added value it has on many ecosystem services that reforestation has on water, recreation, wildlife, timber, and many other valuable resources.

IMPACT

Results from this research are and will continue to be used to inform land managers throughout the western US on reforestation strategies that improve seedling survival and growth.

FUNDING ACKNOWLEDGMENT:

NSF/CREST

USING NUCLEATION PLANTING STRATEGIES FOR PONDEROSA PINE POST-FIRE REFORESTATION

Investigators: Dr. Owen Burney (oburney@nmsu.edu), Dr. Joshua Sloan, and Dr. Aslap Dixit

PROJECT OVERVIEW

The short-term objective (0 – 5 years) is to understand what combination of nucleation size and planting density promotes greater survival and growth for individual ponderosa pine seedlings. The long-term objective (10 – 30 years) is to determine which treatment combination will result in a rapid expansion from each nucleus.

MEETING THE NEEDS OF NEW MEXICO

This research will benefit all communities of New Mexico due to the added value it has on many ecosystem services that reforestation has on water, recreation, wildlife, timber, and many other valuable resources.

IMPACT

Results from this research are and will continue to be used to inform land managers throughout the western US on reforestation strategies that improve seedling survival and growth.

FUNDING ACKNOWLEDGMENT:

NSF/CREST

ASSESSING LOG AND SNAG MICROSITES FOR REFORESTATION OF ASPEN IN A POST-FIRE ENVIRONMENT

Investigators: Dr. Owen Burney (oburney@nmsu.edu), Dr. Karen Mock, and Dr. Larissa Yocom (PI) (Larissa.yocom@usu.edu)

PROJECT OVERVIEW

The focus of this study is to understand the influence of log and snag microsites (i.e., soil moisture, shading, etc.) on out-planted aspen seedling performance.

MEETING THE NEEDS OF NEW MEXICO

This research will benefit all communities of New Mexico due to the added value it has on many ecosystem services that reforestation has on water, recreation, wildlife, timber, and many other valuable resources.

IMPACT

Results from this research are and will continue to be used to inform land managers throughout the western US on reforestation strategies that improve seedling survival and growth.

FUNDING ACKNOWLEDGMENT:

PHYSIOLOGICAL AND MORPHOLOGICAL RESPONSES OF PINUS PONDEROSA SEEDLINGS TO MOISTURE LIMITATIONS IN THE NURSERY AND THEIR IMPLICATIONS FOR RESTORATION

Investigators: Dr. Owen Burney (oburney@nmsu.edu), Dr. Joshua Sloan, and Dr. Jeremy Pinto (PI)

PROJECT OVERVIEW

The objective of this study was to examine the effects of reduced water delivery during the nursery growth phase on the structure and function of *P. ponderosa* to improve survival and growth on dry, harsh out-planting sites. Additionally, this study assessed, to a limited extent, the potential interactions between seed source (i.e., genetic influence) and water limitations during nursery production (i.e., environmental influence).

MEETING THE NEEDS OF NEW MEXICO

This research will benefit all communities of New Mexico due to the added value it has on many ecosystem services that reforestation has on water, recreation, wildlife, timber, and many other valuable resources.

IMPACT

Results from this research are and will continue to be used to inform land managers throughout the western US on reforestation strategies that improve seedling survival and growth.

FUNDING ACKNOWLEDGMENT: USDA McIntire Stennis

INFLUENCE OF POST-FIRE SNAGS ON MICROSITE PLANTING ENVIRONMENTS

Investigators: Dr. Owen Burney (oburney@nmsu.edu), Dr. Simon Landhäusser (PI), and Dr. Charles Nock

PROJECT OVERVIEW

The main objective of this study is to determine if residual stems in burned forested landscapes influence regeneration efforts via tree planting. Specific objectives include: 1) determining if snags aid in soil moisture concentration through stemflow, 2) the impacts of stemflow on planted aspen, and 3) determining stem flow patterns in relation to weather events.

MEETING THE NEEDS OF NEW MEXICO

This research will benefit all communities of New Mexico due to the added value it has on many ecosystem services that reforestation has on water, recreation, wildlife, timber, and many other valuable resources.

IMPACT

Results from this research are and will continue to be used to inform land managers throughout the western US on reforestation strategies that improve seedling survival and growth.

DEVELOPING CARBON SEQUESTRATION MODELS FOR POST-FIRE REFORESTATION EFFORTS IN THE SOUTHWESTERN US

Investigators: Dr. Owen Burney (PI) (oburney@nmsu.edu), Dr. Chris Marsh, Dr. Matthew Hurteau, and Dr. Doug Cram

PROJECT OVERVIEW

Given the outsized role forests play in helping to regulate the climate, reforesting severely disturbed areas, such as post-fire environments, has the potential to increase carbon sequestration. However, there is a lack of information regarding how to best calculate the amount of carbon that is being sequestered in reforestation activities. The main objective of this study will be to develop a baseline model for calculating carbon storage of recently planted ponderosa pine (*Pinus ponderosa var. scopulorum*) across the greater southwestern US region.

MEETING THE NEEDS OF NEW MEXICO

This research will benefit all communities of New Mexico due to the added value it has on many ecosystem services that reforestation has on water, recreation, wildlife, timber, and many other valuable resources.

IMPACT

Results from this research are and will continue to be used to inform land managers throughout the western US on reforestation strategies that improve seedling survival and growth.

FOREST REGENERATION DYNAMICS IN RESPONSE TO PLANTING DENSITY, MULCH, AND FERTILIZER IN GEORGIA'S MARITIME FORESTS

Investigators: Dr. Owen Burney (oburney@nmsu.edu) and Dr. Douglass Jacobs

PROJECT OVERVIEW

Maritime forests are important coastal ecosystems that stabilize coastlines, recharge aquifers, and protect us from storm surges. The range of these forests has been decreasing due to threats such as urban expansion, clearing for agriculture, climate change, and an influx of native loblolly pine (*Pinus taeda* L.) from pine plantations. To restore maritime forests, we need to restore southern live oak (*Quercus virginiana* Mill.) as the dominant canopy species however, studies on how to grow live oak in a restoration setting are limited. We planted 720 southern live oak seedlings in a 0.61 Hectare clearcut that was historically a loblolly pine plantation. Our goal was to test how planting density (1-meter, 2-meters, 3-meters), mulch (yes or no), and fertilizer (yes or no) impacted the initial growth of these seedlings over the course of four growing seasons.

MEETING THE NEEDS OF NEW MEXICO

This research expands the visibility of NMSU and the JTH FRC in Mora. As a result, national and global recognition as forest restoration experts will provide added value to all forest restoration efforts conducted in New Mexico.

IMPACT

Results from this research are and will continue to be used to inform land managers throughout the western US on reforestation strategies that improve seedling survival and growth.

CO-PLANTING OF A FAST-GROWING NITROGEN-FIXING HOST TREE FACILITATES REGENERATION OF THE ROOT HEMIPARASITIC 'ILIAHI (HAWAIIAN SANDALWOOD)

Investigators: Dr. Emily Thyroff (PI), Dr. Owen Burney (oburney@nmsu.edu), and Dr. Douglass Jacobs

PROJECT OVERVIEW

Santalum sandalwood species, including the endemic Hawaiian species known as 'iliahi (*Santalum paniculatum*), are ecologically distinct as root hemiparasitic, evergreen trees requiring suitable hosts for long-term resource acquisition. Restoration and sustainable forestry of 'iliahi at degraded sites, including threatened tropical dry forests, therefore, require supporting host plant populations. The objective of this research compared host dynamics for 'iliahi with different hosts at different planting distances. 'Iliahi grew more when paired with koa (*Acacia koa*) at a close distance than with 'a'ali'i (*Dodonaea viscosa*) at any distance or the control with no host. After three years, survival of 'iliahi seedlings was greatest for 'iliahi paired with koa at 1.0 m (88 %) compared to the control with no host (53 %) and when paired with koa at 2.0 m (55 %).

MEETING THE NEEDS OF NEW MEXICO

This research expands the visibility of NMSU and the JTH FRC in Mora. As a result, national and global recognition as forest restoration experts will provide added value to all forest restoration efforts conducted in New Mexico.

IMPACT

Results from this research are and will continue to be used to inform land managers throughout the western US on reforestation strategies that improve seedling survival and growth.

PINUS PONDEROSA CARBON MODELING AND PROVENANCE TEST

Investigators: Dr. Owen Burney (PI) (oburney@nmsu.edu) and Dr. Aalap Dixit

PROJECT OVERVIEW

The climate is changing faster than trees can migrate and/or adapt through both natural regeneration and conventional tree planting practices (Williams & Dumroese, 2013). Therefore, it is fundamental that researchers understand how to build climate resiliency for future forests through the establishment of a network of provenance and common garden tests that will examine a range of genetic sources for traits that increase the potential for genetic diversity and adaptability. These tests will inform seed source selections to promote long-term reforestation success. The objective of this study is to assess the effects of climatic changes across 75 sources of ponderosa pine on survival, growth, physiological parameters, and carbon sequestration over 10 years of growth

MEETING THE NEEDS OF NEW MEXICO

This research will benefit all communities of New Mexico due to the added value it has on many ecosystem services that reforestation has on water, recreation, wildlife, timber, and many other valuable resources

IMPACT

Results from this research are and will continue to be used to inform land managers throughout the western US on reforestation strategies that improve seedling survival and growth
